

Use Example

True Factory

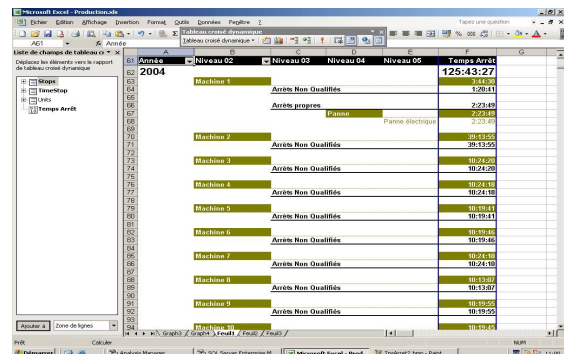

Use case 2: True Factory Suite for “monitoring waste of raw materials”

Objective

- The waste of raw materials during manufacturing was difficult to estimate because it concerned small quantities and was sporadic. But it does represent a significant cost, financially and ecologically for our client. To better identify the problem the client needed a precise way of measuring waste during the production flow.

Implementation

- GENIOP connected True Factory to the automatism of the 8 manufacturing lines and developed specific Intranet production charts to enable the client to work with its teams on the theme of “full pot” waste.
- The maintenance team made the necessary data available in the automats.

Bilan

- It took 7 days for GENIOP to set up the entire project (including 4 days to check the results).
- The client now can consult information updated in real time on the waste of full pots from any computer connected to the Internet.
