

# Use Example

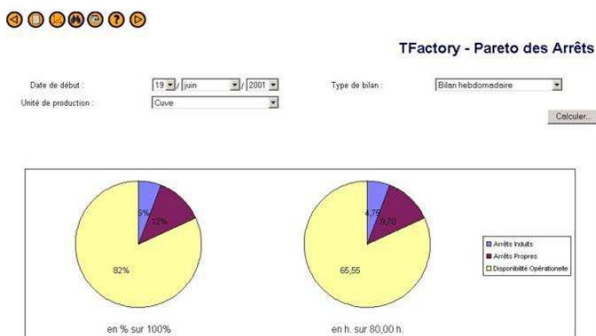

## True Factory

Use case 4: True Factory Suite for “measuring the real productivity of equipment”.

### Objectives

- To improve the productivity of his paint lines, our client had set up a manual system for recording stoppages. Unfortunately, the times recorded by the operators represented only 60% of real stoppages on the lines because the entry procedure was too difficult.

- The project’s objective was to obtain an exhaustive vision of all the stoppages.

### Implementation

- Geniop connected True Factory directly to the manufacturing lines in order to detect the stoppages. The operators only need to indicate the duration of each stoppage.

- The productivity results can be consulted on the client’s Intranet site in real time

### Results

- 100% of all stoppages are recorded. The True Factory system, which is very user-friendly, is well received by operators.
